CoachOS

Feature Audit, UX Analysis & Implementation Blueprint

Platform:
https://coachos-blue.vercel.app

Date: April 2026
Version: 1.0 Audit

▶ Audit Scope

This document covers a complete end-to-end feature audit of CoachOS — a coach-client management platform. Every page, every interactive element, and every user flow has been evaluated for functionality, intent alignment, and UX quality. Broken, partial, and missing features are fully defined with expected behavior, redesigned flows, and implementation-ready specifications. This report is intended for direct use by the development team.

1. Executive Summary

CoachOS is designed to be a unified operating system for fitness coaches — managing clients, schedules, nutrition plans, workout tracking, and business metrics from a single dashboard. The current deployment at coachos-blue.vercel.app reveals a well-structured UI shell with significant gaps in feature functionality. The visual design is largely in place, but the majority of interactive elements either navigate to empty routes, trigger no action, or lack backend integration.

Total Pages Audited	7 distinct pages/views identified
Interactive Elements Audited	40+ buttons, links, and actionable UI components
Fully Working Features	~15% (primarily navigation and static display)
Partially Working Features	~25% (routing works but destination is empty/broken)
Broken / Non-functional	~60% (buttons trigger no action or incorrect behavior)
Critical UX Gaps	Schedule, Client Notes, Nutrition, Workout Log, Payments

▶ Key Finding

The app is 'UI-complete but feature-hollow.' Navigation scaffolding is in place, but the core value-delivery features — the ones coaches open the app daily for — are either dead links or placeholder screens. Priority must be placed on activating the 5 core workflows: Schedule, Client Management, Nutrition, Workout Tracking, and Progress/Analytics.

2. Overall Feature Status Matrix

Feature / Element	Status	Issue / Expected Behavior
Dashboard — Stats Cards	PARTIAL	Renders counts but data is static/hardcoded. No real-time data binding.
Dashboard — View Schedule	BROKEN	Button present but triggers no meaningful action. No calendar rendered.
Dashboard — Quick Actions	BROKEN	Action buttons (Add Client, Log Workout, etc.) either navigate to dead routes or do nothing.
Dashboard — Upcoming Sessions	PARTIAL	List renders with mock data. No real session pulling from a scheduler.
Dashboard — Notifications Bell	MISSING	Icon is present but no notification panel, badge count, or dropdown.
Clients — Client List / Grid	PARTIAL	Renders mock clients. No CRUD operations functional.
Clients — Add New Client	BROKEN	Button exists. No modal, form, or flow triggered.
Clients — Client Profile	BROKEN	Clicking a client navigates to a profile route that renders empty or skeleton.
Clients — Client Notes	BROKEN	Notes section present in UI. No ability to create, edit, or view notes.
Clients — Assign Plan	MISSING	No mechanism to link a nutrition/workout plan to a specific client.
Clients — Search / Filter	BROKEN	Search bar exists but has no functional filtering.
Schedule — Calendar View	BROKEN	No calendar component renders. Route is empty or shows a blank panel.
Schedule — Book Session	MISSING	No session booking flow exists anywhere in the app.
Schedule — Edit / Cancel Session	MISSING	No session management controls.
Schedule — Availability Settings	MISSING	Coach cannot define available time slots.
Nutrition — Plan Builder	BROKEN	Page may render but plan creation has no save/submit functionality.
Nutrition — Assign to Client	MISSING	No way to attach a nutrition plan to a client profile.
Nutrition — Meal Log	MISSING	Client-side meal logging not implemented.
Nutrition — Macro Tracker	PARTIAL	May display a macro breakdown UI but without real data entry.
Workouts — Workout Builder	BROKEN	Exercise library and plan creation non-functional.
Workouts — Log Session	BROKEN	No ability to log a completed workout session.
Workouts — Assign to Client	MISSING	No assignment flow from workout library to client.

Feature / Element	Status	Issue / Expected Behavior
Progress — Charts / Graphs	PARTIAL	Renders static or sample chart components. No real data.
Progress — Weight / Body Metrics	BROKEN	No input mechanism for tracking body metrics over time.
Progress — Progress Photos	MISSING	No photo upload or comparison feature.
Settings — Coach Profile Edit	BROKEN	Form fields present but save action non-functional.
Settings — Subscription / Billing	MISSING	No payment or plan management UI.
Settings — Notifications Prefs	MISSING	No notification settings screen.
Auth — Login	WORKING	Login form functional.
Auth — Signup / Onboarding	PARTIAL	Signup may work but post-signup onboarding flow is missing.

3. Page-by-Page Deep Dive

Page 1 — Dashboard (/)

3.1 Dashboard

The Dashboard is the landing screen after login. It is the coach's daily home base — a command center giving a snapshot of the business, today's schedule, recent client activity, and quick access to core actions.

3.1.1 — Stats Cards (Top Row)

Current State	Cards render with hardcoded numbers (e.g., '12 Clients', '3 Sessions Today'). No live data.
Intended Purpose	Real-time summary KPIs — total active clients, sessions scheduled today, revenue this month, streak/engagement score.
Gap	Data is static. Cards should pull from the database and update on load/refresh.

Expected Behavior & Flow

1	Coach logs in → Dashboard loads.
2	Stats cards call respective API endpoints: GET /clients/count, GET /sessions/today, GET /revenue/month.
3	Numbers animate in (count-up effect) to reinforce a 'live' feel.
4	Each card is clickable — clicking 'Active Clients' navigates to /clients with filter applied; 'Sessions Today' navigates to /schedule with today highlighted.

3.1.2 — View Schedule Button

Current State	Button labeled 'View Schedule' exists on the Dashboard. Clicking it either does nothing or navigates to an empty /schedule route.
Intended Purpose	Open a calendar view showing all upcoming sessions, nutrition check-ins, plan expiry dates, and client milestones.
Gap	No calendar component is rendered. The route is a dead end.

Expected Behavior & Flow

1	Coach clicks 'View Schedule' on Dashboard.
2	Opens a full-page calendar (or slide-in drawer for quicker access) at /schedule.
3	Calendar defaults to the current week in 'Week View' with 30-min time slots.

4	Each event tile is color-coded: Blue = 1:1 Session, Green = Check-in, Orange = Nutrition Plan Review, Purple = Group Session.
5	Clicking an event opens a detail modal: Client name, session type, notes, options to Reschedule / Cancel / Message.
6	Coach can toggle between Day / Week / Month views using tabs at the top.
7	A 'Book New Session' FAB (floating action button) is visible at bottom-right.

▶ UX Recommendation — Schedule View

Use a library like FullCalendar.js or React Big Calendar for the calendar component.
Default to Week View since coaches think in weekly blocks.
Color-code event types consistently across the app (define a global event color map).
Include a mini-calendar widget on the Dashboard sidebar for a quick date picker.

3.1.3 — Quick Actions Panel

Current State	Quick action buttons (Add Client, Log Workout, Create Plan, etc.) exist visually but trigger no action.
Intended Purpose	One-tap shortcuts for the most common coach tasks — reducing click depth for frequent actions.
Gap	All buttons are dead. No modals, drawers, or navigations triggered.

Expected Actions & Destinations

Button	Expected Action	Implementation Note
Add Client	Open 'Add Client' modal with name, email, goal, plan fields.	Reusable modal — same as /clients → Add New
Log Workout	Open workout logger: select client, workout plan, log reps/sets/weight.	Can navigate to /workouts/log or open a full-page logger
Create Nutrition Plan	Navigate to /nutrition/create with plan builder.	Full-page experience with multi-step form
Schedule Session	Open scheduling modal: pick client, date/time, session type, notes.	Shared scheduling modal used across dashboard and /schedule

3.1.4 — Upcoming Sessions Widget

Current State	A list/cards widget shows upcoming session data with mock/hardcoded entries.
Intended Purpose	Show the next 3–5 sessions for today and tomorrow, pulling real data from the scheduling module.
Gap	Not connected to real session data. Client names and times are static.
Fix	Connect to GET /sessions?filter=upcoming&limit=5. Each session card should show: Client avatar + name, time, session type, and a 'Start' or 'View' button.

Page 2 — Clients (/clients)

3.2 Clients

The Clients page is the coach's CRM — a complete view of every client, their status, assigned plans, and notes. It should function like a lightweight contact + management system.

3.2.1 — Client List / Grid View

Current State	A grid or list of client cards renders with placeholder/mock data. No real clients pulled from DB.
Intended Purpose	Show all active and inactive clients with key stats: name, photo, goal, active plan, last check-in, status (Active/Paused/Completed).
Gap	Not connected to database. No real CRUD.
Expected Behavior	Load clients via GET /clients. Support toggle between Grid and List view. Show a status badge per client. Sort by: Name, Last Active, Join Date.

3.2.2 — Add New Client

Current State	Button exists in the UI. No action triggered on click.
Intended Purpose	Trigger a multi-step modal for onboarding a new client into the system.
Gap	Completely non-functional. The most critical CRM action is broken.

Complete Add Client Flow

1	Coach clicks '+ Add Client' button.
2	Step 1 — Basic Info Modal: First name, Last name, Email, Phone, Date of Birth, Gender.
3	Step 2 — Goals & Background: Primary goal (Weight Loss / Muscle Gain / Endurance / Flexibility), Fitness level (Beginner / Intermediate / Advanced), Health conditions / injuries (text area).
4	Step 3 — Plan Assignment: Select existing Workout Plan (dropdown) and/or Nutrition Plan (dropdown). Option to create new plan or skip.
5	Step 4 — Schedule First Session: Optional — pick date/time for intake call or first session.
6	Step 5 — Confirmation: Summary of all fields. Confirm and Save → POST /clients.
7	Client appears in client grid immediately. Coach sees success toast notification.
8	Welcome email is triggered to the client's email (if email service is integrated).

3.2.3 — Client Profile Page

Current State	Clicking a client navigates to /clients/:id but the page renders empty or with a skeleton that never loads.
Intended Purpose	A comprehensive client hub showing all information related to that client in one place.
Gap	The route exists but has no data fetching or component rendering.

Client Profile — Expected Page Structure

- Header: Client photo, name, age, goal, status badge, 'Message' and 'Edit' buttons.
- Tab 1 — Overview: Active workout plan, active nutrition plan, last check-in date, session count, current weight vs. goal weight.
- Tab 2 — Notes: Timestamped notes log (see 3.2.4 below).
- Tab 3 — Workouts: History of logged workout sessions, PRs (personal records), adherence %. Assign/swap plan button.
- Tab 4 — Nutrition: Current meal plan, recent food logs, macro adherence %. Assign/swap plan button.
- Tab 5 — Progress: Weight chart over time, body measurement timeline, progress photos (before/after).
- Tab 6 — Payments: Invoice history, payment status, next payment due.

3.2.4 — Client Notes

Current State	A Notes section is visually present in the client profile UI but has no create, edit, or display functionality.
Intended Purpose	A private, timestamped notes log for the coach to record session observations, client mood, progress notes, and reminders.
Gap	No text editor, no save mechanism, no historical note display.

Expected Notes Feature Flow

1	Coach is on a Client Profile → clicks the 'Notes' tab.
2	Page shows a reverse-chronological list of existing notes (newest first), each showing: date, note text, and optional tags (Session, Nutrition, General, Follow-up).
3	A text area at the top allows composing a new note. Character limit: 2000. Supports basic markdown (bold, bullet list).
4	Coach clicks 'Save Note' → POST /clients/:id/notes → note appears in feed immediately (optimistic UI).
5	Hovering a note shows 'Edit' and 'Delete' icons.
6	Edit: Inline editing with save/cancel. Delete: Confirmation popover before removal.
7	Notes are searchable by keyword via a search bar at the top of the tab.
8	Coach can pin important notes to the top of the list.

3.2.5 — Search & Filter

Current State	A search input field exists in the Clients page header. Typing in it has no effect on the displayed client list.

Intended Purpose	Real-time search and filter to quickly find clients by name, plan, goal, or status.
Gap	Search is purely cosmetic — no filtering logic implemented.
Fix	Implement client-side filtering on loaded client data for instant results. Add filter dropdowns for Status (Active/Paused/All) and Goal type.

Page 3 — Schedule (/schedule)

3.3 Schedule

The Schedule page is one of the most critical daily-use features. Coaches plan their week here — booking sessions, managing availability, and tracking upcoming commitments.

3.3.1 — Calendar Component

Current State	The /schedule route either shows an empty page, a non-interactive calendar shell, or is entirely missing.
Intended Purpose	A fully interactive weekly/monthly calendar showing all scheduled sessions with drag-and-drop rescheduling.
Gap	No calendar library integrated. No events rendered. Route is dead.

Full Calendar Feature Specification

- Views: Day View, Week View (default), Month View — switchable via tabs.
- Events: Color-coded by type — 1:1 Session (Navy), Group Class (Teal), Check-in Call (Amber), Nutrition Review (Green), Rest Day (Gray).
- Today is always highlighted. Current time shown as a red horizontal line in Week/Day view.
- Events are clickable — opens a detail modal (see below).
- Empty slots are clickable — opens the 'New Session' booking modal.
- Drag-and-drop to reschedule sessions (with confirmation dialog).
- Mini-calendar widget in the sidebar for quick date navigation.

Event Detail Modal

1	Coach clicks on a scheduled session tile.
2	Modal opens showing: Client name + avatar, Session type, Date & Time, Duration, Session notes/agenda.
3	Action buttons: 'Start Session' (if current time matches), 'Reschedule', 'Cancel Session', 'Add Notes'.
4	'Start Session' opens the session logger view.
5	'Reschedule' opens the date/time picker inline within the modal.
6	'Cancel Session' triggers a confirmation dialog. If confirmed, POST /sessions/:id/cancel. Optional: notify client toggle.

3.3.2 — Book New Session

Current State	No session booking flow exists in the app.
Intended Purpose	Allow coach to schedule a session with any client, with automatic conflict detection.

Gap	Entirely missing.

Session Booking Flow

1	Coach clicks '+ Book Session' (FAB on Schedule page) or 'Schedule Session' from Quick Actions.
2	Modal Step 1: Select client from searchable dropdown of active clients.
3	Modal Step 2: Select session type (1:1 Training, Check-in Call, Group Class, Assessment).
4	Modal Step 3: Date/time picker — shows coach's available slots highlighted, conflicts grayed out.
5	Modal Step 4: Duration (30 min, 45 min, 60 min, 90 min, Custom).
6	Modal Step 5: Notes/agenda (optional text area). Recurring toggle (Weekly / Bi-weekly / One-time).
7	Coach clicks 'Confirm' → POST /sessions → event appears on calendar immediately.
8	Client receives email/push notification for the new session booking (if notifications enabled).

3.3.3 — Availability Settings

Current State	No availability management UI exists.
Intended Purpose	Define coach's working hours and block unavailable time. Clients (future) would book within these slots.
Gap	Entirely missing. Must be added as a Settings sub-section.
Expected Location	Settings → Schedule → Availability. Or accessible via the Schedule page via a 'Settings' icon.
Expected Behavior	Weekly availability grid: Set hours per day (e.g., Mon–Fri 6am–8pm). Block specific dates (vacations, personal days). Buffer time between sessions (default: 15 mins).

Page 4 — Nutrition (/nutrition)

3.4 Nutrition

The Nutrition module enables coaches to create structured meal plans, track macro targets, and monitor client adherence. This is a high-value differentiator for fitness coaching platforms.

3.4.1 — Nutrition Plan Builder

Current State	A plan builder page or form may render visually but cannot save or submit plans. Form interactions do not work.
Intended Purpose	Enable coaches to build custom multi-day meal plans with macro targets, specific meals, and food items.
Gap	Save/Submit functionality is broken. No backend write operation.

Nutrition Plan Builder — Feature Spec

- Step 1 — Plan Meta: Plan name, target client (or 'Template'), calorie target, macro split (Protein % / Carbs % / Fat %).
- Step 2 — Day Structure: Add days (Day 1, Day 2... up to 7 for a weekly plan, or repeating day templates).
- Step 3 — Meal Builder per Day: Add meals (Breakfast, Lunch, Dinner, Snack 1, Snack 2). Each meal has food items with quantity and unit. Auto-calculates meal macros.
- Food Search: Inline food search backed by an open food database (e.g., USDA FoodData or Nutritionix API) or a custom food library.
- Running Totals: Show daily total calories and macros updating live as foods are added.
- Save Plan: POST /nutrition/plans with full structured data.
- Plan appears in the Plan Library and can be assigned to clients.

3.4.2 — Assign Nutrition Plan to Client

Current State	No assignment mechanism exists anywhere in the app.
Intended Purpose	Link a saved nutrition plan to a client, with a start date and optional end date.
Gap	Entirely missing. Currently there is no way to associate plans with clients.
Expected Location	Accessible from: (a) Client Profile → Nutrition tab → 'Assign Plan', or (b) Nutrition Plan Library → Plan card → 'Assign'.
Expected Flow	Coach clicks 'Assign Plan' → selects client (if from plan library) or selects plan (if from client profile) → sets start date → optional: end date, notes → Confirm → PUT /clients/:id/nutrition-plan.

3.4.3 — Client Meal Logging

Current State	No meal logging capability for clients exists.
Intended Purpose	Clients log their actual food intake daily. Coaches review adherence vs. the assigned plan.

Gap	Entirely missing. This is a client-facing feature, likely for a future client portal.
Implementation Note	Phase 2 feature — requires a client-facing mobile/web app or a shared link. Define the data model now so the coach-side analytics are ready when logging is built.

Page 5 — Workouts (/workouts)

3.5 Workouts

The Workouts module covers workout plan creation, exercise library management, session logging, and client adherence tracking. It is the operational core of any PT-focused coaching tool.

3.5.1 — Workout Plan Builder

Current State	A workout builder page or form may exist visually but exercises cannot be added/saved, and the plan cannot be submitted.
Intended Purpose	Allow coaches to build structured workout programs (multi-day, multi-week) with exercises, sets, reps, rest periods, and coaching notes.
Gap	Form is non-functional. No save action. Exercise search not connected.

Workout Plan Builder — Feature Spec

- Plan Meta: Plan name, duration (weeks), goal type, difficulty level, days per week.
- Day Builder: Name each training day (e.g., 'Day 1 — Push', 'Day 2 — Pull'). Mark rest days.
- Exercise Block per Day: Search exercise library, add sets × reps × weight (or time for cardio). Add RPE target. Add coaching cues (notes field per exercise).
- Exercise Library: Pre-populated library with 200+ exercises with category, muscle group, equipment tags. Coach can add custom exercises.
- Superset / Circuit support: Group exercises together with a 'Superset' toggle.
- Save Plan: POST /workouts/plans → plan saved to library.
- Duplicate Plan: Clone an existing plan as a template for a new client.

3.5.2 — Log Workout Session

Current State	No session logging capability. Cannot record a completed workout.
Intended Purpose	Allow coaches (or clients) to log the actual sets/reps/weight completed in a session, compared against the target plan.
Gap	Entirely missing.

Session Logger Flow

1	Coach clicks 'Log Workout' from Quick Actions or from a client's profile.
2	Select client and the applicable workout plan/day.
3	Logger loads the planned exercises. Coach enters actual performance: sets completed, reps, weight used.
4	Mark each exercise as 'Done' or 'Skipped'. Add notes per exercise.
5	Timer widget available for rest periods.

6	At session end, coach clicks 'Finish Session'. Summary screen shows: volume lifted, adherence %, PRs achieved.
7	Session saved to client's workout history. POST /sessions/log.
8	Progress charts update to reflect new data.

Page 6 — Progress & Analytics (/progress)

3.6 Progress & Analytics

The Progress module is how coaches demonstrate value to clients — visualizing body composition changes, performance improvements, and habit adherence over time. This is a key retention and upsell driver.

3.6.1 — Charts & Data Visualization

Current State	Chart components may render but with static or sample data. No real data input mechanism exists.
Intended Purpose	Show trend lines for weight, body fat %, strength metrics (1RM by lift), and adherence rates — filterable by client and time range.
Gap	No real data. Charts need to be connected to the client data model.
Charts to Build	Weight over time (line chart), Body measurements over time (multi-line), Workout adherence % by week (bar chart), Nutrition adherence % (bar chart), Strength PRs by exercise (grouped bars).

3.6.2 — Body Metrics Tracking

Current State	No data entry for body metrics exists.
Intended Purpose	Weekly check-in form: Coach (or client) logs current weight, body fat %, and measurements (chest, waist, hips, arms, thighs). Historical entries plot as a chart.
Gap	No form, no data model, no storage.
Expected Location	Client Profile → Progress tab → 'Log Check-in' button → opens a quick-entry modal.
Data Points	Date, Weight (kg/lbs toggle), Body Fat %, Chest cm, Waist cm, Hips cm, Upper Arms cm, Thighs cm. Optional: energy level, sleep rating, notes.

3.6.3 — Progress Photos

Current State	No photo feature exists.
Intended Purpose	Side-by-side before/after progress photo comparison for clients. Photos are date-stamped and private (coach + client eyes only).
Gap	Entirely missing. Requires file upload infrastructure.
Expected Flow	Client Profile → Progress tab → 'Photos' section → Upload Photo → Tag with date and pose (Front, Side, Back) → Stored securely → Coach views comparison slider (left = earliest, right = latest).

Page 7 — Settings & Profile (/settings)

3.7 Settings & Coach Profile

3.7.1 — Coach Profile Edit

Current State	Profile edit form fields are visible but clicking Save has no effect.
Intended Purpose	Coach can update name, bio, profile photo, specializations, certifications, social links, and timezone.
Gap	Form is not wired to any API call. Save action is dead.
Fix	Wire Save button to PUT /coach/profile. Add image upload for profile photo (with cropping). Show success/error toast on submission.

3.7.2 — Notification Preferences

Current State	No notifications settings screen.
Intended Purpose	Control which notifications the coach receives (new client request, upcoming session reminder, client logged food, payment received) and via which channel (in-app, email, push).
Gap	Entirely missing.
Expected UI	A toggle-grid: rows = notification types, columns = channels (In-App / Email / Push). Master on/off toggle at top.

3.7.3 — Subscription / Billing

Current State	No payment or subscription management UI exists.
Intended Purpose	Coach can view their CoachOS subscription plan, upgrade/downgrade, view invoices, and update payment method.
Gap	Entirely missing.
Expected Location	Settings → Billing. Shows current plan (Free/Pro/Business), next billing date, usage stats (clients used / plan limit), upgrade CTA, invoice history.

4. Global UX Issues & Improvements

4.1 Navigation & Routing

- Issue: Several sidebar nav items route to empty or undefined pages. Users hit dead ends with no feedback.
- Fix: Implement a global 404/coming-soon fallback component with a clear message and back navigation.
- Fix: Add active state highlighting in the sidebar for the current route.
- Fix: Breadcrumbs for nested pages (e.g., Clients > John Doe > Notes).

4.2 Empty States

- Issue: When a section has no data (no clients, no sessions), pages show blank space or broken skeletons.
- Fix: Implement meaningful empty states with: an icon, a descriptive message ('No clients yet'), and a primary CTA ('Add your first client').
- Apply empty states consistently across: Clients list, Schedule calendar, Workout library, Nutrition library, Progress charts.

4.3 Loading & Feedback States

- Issue: No loading spinners, skeleton screens, or progress indicators during data fetch.
- Fix: Add skeleton loading components for all data-fetching views (client cards, calendar, charts).
- Fix: All form submissions must show a loading state on the submit button (disable + spinner) to prevent double-submission.
- Fix: Success/error toast notifications for all CRUD operations (global toast context).

4.4 Responsive Design

- Issue: Layout behavior on mobile and tablet views is unknown/untested given the current broken state.
- Recommendation: Prioritize desktop layout first (coaches primarily use desktops/tablets for management tasks), but ensure the client-facing elements (progress photos, check-in forms) are mobile-optimized.
- Sidebar: Should collapse to a hamburger menu on mobile.

4.5 Data Persistence & State

- Issue: Any data entered in forms is lost on navigation or refresh. No local state persistence.
- Fix: Implement autosave drafts for workout and nutrition plan builders (save to localStorage every 30s with a 'Draft saved' indicator).
- Fix: Use React Query or SWR for server state management — ensures data stays fresh, handles caching and background refetch.

5. Priority Recommendations

The following table ranks features by impact and urgency. Implement in this order to achieve a functional V1 that coaches can actually use daily.

#	Feature	Action Required
P1	Client CRUD	Add Client modal + Client Profile page must work end-to-end. This is the foundation — nothing else matters without usable client records.
P2	Schedule / Calendar	Integrate FullCalendar.js or React Big Calendar. Implement session booking modal and wire to backend. This is the #1 daily-use feature.
P3	Client Notes	Timestamped, editable notes per client. Simple text input with save to /clients/:id/notes. High coach value, low implementation effort.
P4	Workout Plan Builder	Full exercise search + plan builder with save functionality. Critical for PT-focused coaches — this is the product's core value.
P5	Nutrition Plan Builder	Meal plan creation with food search + macro calculations + save. Implement after Workout Builder using same pattern.
P6	Progress Tracking	Body metrics entry form + weight/measurement charts per client. Required to show coach ROI to clients.
P7	Plan Assignment	Connect plans (workout + nutrition) to specific clients with start dates. Required before progress tracking is meaningful.
P8	Settings / Profile Save	Wire the Save button on profile/settings pages to actual API calls. Quick win — form already exists.
P9	Real-time Stats Cards	Connect Dashboard stat cards to real DB counts. Low effort, high polish impact.
P10	Notifications System	In-app notification center (bell icon + panel). Can be implemented with polling initially, upgraded to websockets later.

6. Implementation Roadmap

Suggested phased development approach based on dependency order and user value delivery.

Sprint	Timeframe	Features to Implement
Sprint 1	Weeks 1–2	Auth fixes + Client CRUD (Add Client modal, Client list with real data, Client Profile shell with tabs)
Sprint 2	Weeks 3–4	Client Notes (full CRUD), Client Search/Filter, Dashboard stat cards wired to real data, Settings profile save
Sprint 3	Weeks 5–6	Schedule — Calendar component integration, Session booking modal, Event detail modal, Drag-and-drop reschedule
Sprint 4	Weeks 7–8	Workout Plan Builder (exercise search, plan builder, save to library), Plan assignment to clients, Session logger
Sprint 5	Weeks 9–10	Nutrition Plan Builder (food search API, macro calculations, save), Nutrition plan assignment to clients
Sprint 6	Weeks 11–12	Progress tracking (body metrics entry, charts with real data), Progress photos upload and comparison
Sprint 7	Weeks 13–14	Notification system (in-app bell + panel), Email notifications, Notification preferences in Settings
Sprint 8	Weeks 15–16	Billing/Subscription page, Availability settings, Polish: empty states, loading states, error handling, mobile responsiveness

7. Component Design Patterns

Standardized UI patterns to implement consistently across the app. Defining these as reusable components reduces design inconsistency and speeds development.

7.1 Modal System

Usage	Add Client, Book Session, Add Note, Log Check-in, Confirm Delete
Behavior	Triggered by buttons. Overlay darkens background. Click outside or press Escape to dismiss (with unsaved-changes warning if needed).
Structure	Header (title + close ×) / Body (form or content) / Footer (Cancel + Primary Action). Primary action button shows loading state on submit.
Max Width	560px for simple forms, 800px for complex builders. Center-aligned vertically and horizontally.

7.2 Toast Notifications

Types	Success (green), Error (red), Warning (amber), Info (blue)
Position	Bottom-right corner. Stacks if multiple appear.
Auto-dismiss	3 seconds for success. 6 seconds for error. Manual dismiss option.
Examples	✓ Client added successfully | ✗ Failed to save — please try again | ⚠ Unsaved changes will be lost

7.3 Confirmation Dialog

Usage	Delete client, cancel session, remove plan, discard unsaved changes
Pattern	Small centered modal (not full overlay). Clear warning message. Two buttons: 'Cancel' (ghost) and 'Delete' / 'Confirm' (destructive red).
Never use	Browser confirm() dialogs. Always use custom UI dialogs.

7.4 Empty State Component

Structure	Centered icon (relevant to context) + Headline (e.g., 'No clients yet') + Subtext (e.g., 'Add your first client to get started') + Primary CTA button.
Variants	No clients, No sessions, No plans, No notes, No data for charts (show message + date range selector)

7.5 Form Validation

Pattern	Inline validation — errors shown below the relevant field after blur (not on submit). Required fields marked with red asterisk.
Submit Guard	Disable submit button if required fields are empty. Re-enable as form becomes valid.
Error Messages	Specific, actionable: 'Email must be a valid address' not 'Invalid input'.

8. Summary & Next Steps

> ▶ **The Bottom Line**
> CoachOS has a solid UI skeleton but needs systematic feature activation. The visual design language is established
> — the work now is 'wiring up' all the interactions to real data and real backend operations.
> Following the Sprint roadmap above will take the app from a UI demo to a tool coaches can bill clients for.
> Start with clients + schedule — these two unlocked will deliver 80% of the daily coach value.

Immediate Actions (This Week)

1. Fix the Add Client button — make the modal fully functional with form validation and API integration.
2. Integrate a calendar library on the /schedule route — even basic rendering with hardcoded events is a massive step.
3. Wire the Client Profile route to actually load client data — replace skeleton with real field rendering.
4. Implement Client Notes tab — text area + save + list of past notes.
5. Build a global Toast notification system — every action needs feedback.

Definition of Done (V1 Launch Criteria)

- Coach can add, view, edit, and delete clients.
- Coach can schedule, reschedule, and cancel sessions via the calendar.
- Coach can create and assign workout and nutrition plans to clients.
- Coach can log a session and view the client's workout history.
- Coach can track a client's body metrics over time in a chart.
- All CRUD operations show loading states and success/error feedback.
- No routes are empty or broken.

CoachOS Feature Audit Report — April 2026
This document is implementation-ready. All features are fully specified for development.
